

How the roles relate

One job, nine roles, one system. Six roles hand the job forward through four stages; QA cross-cuts them all. This is the map that ties the persona set together.

THE JOURNEY OF A JOB THROUGH PROSHOP

CROSS-CUTTING PERSONA

Functional QA

Owns product quality (parts) **and** system quality (QMS) across every stage.

- 2 Sets Contact-page requirements (FAI, CFC, form format)
- 3 Approves inspection plan (dim tags + equipment)
- 5 Gates print approval (unblocks the operator)
- 6 Assembles cert packet (NCRs, RMAs, dispositions)

THE ONE THING TO REMEMBER

These stages **share one database**. What the Estimator assumes becomes the Operator's target. What the Receiver uploads becomes the cert packet the Shipper sends. Each role works from a different dashboard, but they're all filtered views of the same work orders — so a change one person makes, everyone downstream sees. That single-source-of-truth is ProShop's entire reason to exist.

SHARED THREADS ACROSS THE WHOLE SHOP

The journey shows how work flows *between* roles. These are the records they all touch — the parts of ProShop that only make sense once you see several personas depending on them. One person sets or contributes; several depend on the result.
