

Functional QA

Owens product quality and system quality at once — proving every part meets its print, and keeping the whole shop certified.

CROSS-CUTTING

“ If it isn't measured, documented, and cert-packed, it doesn't leave the building.

WHO THEY ARE

Functionally, QA proves every part meets its print — approving inspection plans, calibrating equipment, running incoming / in-process / final inspections, generating first-article reports, and assembling the cert packet that ships in the box. Systemically, they own the QMS: the Standard (AS9100 / ISO), Quality Manual, Procedures, Task/Training records, Audit Reports, and controlled Documents that keep the shop certified.

In small shops it's one seat wearing both hats. In larger shops it splits into a shop-floor Inspector and a QMS / Compliance Manager working off the same modules. Unlike the other roles, QA cross-cuts every stage rather than sitting in one.

A DAY IN THE LIFE

Require	Reviews new POs; flags FAI, CFC, and form format on the Customer Contact page — requirements flow from here.
Plan	Reviews the planner's dim-tagged inspection plan; confirms each dim has the right equipment assigned.
Approve	Approves the print — that's what turns the WO banner green so operators can start.
Calibrate	Keeps the Equipment module current — gauges cycle between in-cal, active, and retired.
Inspect	Works the Inspection dashboard top-down; runs final & FAI, records results, generates the cert packet.
Close	Creates NCRs for out-of-tol dims; dispositions use-as-is / repair / scrap; handles RMAs on returns.

SNAPSHOT

Workflow role	Cross-cutting
Two jobs	Parts + the QMS
Gate they own	Print approval
Standards	AS9100 / ISO 13485
Reviewed	Monthly mgmt review

ENVIRONMENT & TECH COMFORT

Split personality by design: an Inspector at a bench with gauges, CMMs, and physical parts, and a Compliance Manager at a desk in documents and audit records. Precision-obsessed, detail-driven, and accountable to external auditors — correctness always beats speed here.

Software proficiency	High
Compliance / standards depth	Very high
Tolerance for ambiguity	Very low

IN THEIR WORDS

“Every requirement in the Standard has to tie to a procedure, to the training that certifies who can do it. The whole chain is the difference between keeping certification and losing the customer.”

WHAT DRIVES THEM — AND WHAT GETS IN THE WAY

The lens Product & Design should hold when building for this user: what they're trying to achieve, where the current experience fails them, and what they need from the product to succeed.

● GOALS

- Zero bad parts shipped, zero missing certs in the packet.
- Every dim traceable to the gauge that measured it and who signed off.
- Pass every external audit clean — keep AS9100 / ISO current.
- Turn NCRs into procedure updates so the same issue doesn't recur.

● FRUSTRATIONS

- AS9102 form contents are constantly debated by clients — what populates where.
- No multi-part FAI: one WO = one FAI, even when a client wants a batch.
- Serial numbers for identified parts don't auto-populate to the AS9102 form.
- The cert-packet PDF combine can fail if the file drive isn't set up.

● NEEDS FROM PROSHOP

- Configurable AS9102 / CFC field mapping to end the client-by-client debates.
- Multi-part FAI support — one report across a batch of work orders.
- Auto-populated serial numbers and identified-part fields on the forms.
- A cert-packet generator that never silently fails to assemble.

THE NUMBERS THEY'RE MEASURED ON

OTD

Date-shipped vs. due-date, measured when the packing slip is created.

NCR count

Out-of-tolerance dims caught — and how many escaped.

RMA rate

Customer returns and how fast they're dispositioned.

Audit findings

Internal and external — and corrective-action closure time.

WHERE THEY SIT IN THE FLOW

TOUCHES ALL

Every stage

Sets requirements, gates the print, checks parts

SPECS
→

THIS PERSONA

Functional QA

Proves the parts and proves the system

CERT PACKET
→

FEEDS

Shipping

Receives the passed parts + cert packet

Functional QA proves the part; the QMS proves the shop. QA is drawn here as cross-cutting because it sets requirements upstream (Contact page), gates production mid-stream (print approval), and closes the loop downstream (cert packet) — the only persona that touches every stage.
